Understanding lamb finishing systems and their impact on product quality

Richard Ehrhardt Senior Extension Specialist-Small Ruminants Michigan State University

MICHIGAN STATE

Lamb rearing systems:

- •Grain feeding: preweaning to market
- •Background: slower rate of growth on pasture for variable period of time followed by grain finishing
- •Near exclusive pasture rearing: rearing on pasture for all or majority of rearing period-no grain feeding
- •Pasture rearing with grain supplement: rearing on pasture and supplementing with grain during the finishing period
- 3

Lamb growth concepts

- Maturity profoundly influences:
 - ✓ Growth rate
 - ✓ Body composition
 - ✓ Feed efficiency
- Lambs of the same size may also differ in the shape of their growth curve and in carcass traits

Overview:

- •Methods of raising market lambs
- •Factors that impact growth, feed efficiency and product quality
- ·Comparison of rearing systems and their economics

2

Basic concepts of lamb growth

- Bone> muscle>>> fat
- Body composition is a function of maturity (degree of mature size), sex, and growth rate
- Lambs with larger mature size potential are leaner at a given body weight than those of smaller mature size potential
- Overall, body composition is *remarkably* similar between breeds when lambs are compared at the same degree of maturity.

4

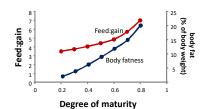

Lambs at the same size but not maturity: Polypay vs. Suffolk lamb at 130 lbs

	Polypay	Suffolk
Mature size (lbs)	175	230
% of mature size	74%	56%
Muscle (lbs)	33.2	35.4
Bone (lbs)	8.3	9.2
Fat (lbs)	23.4	18.4

Polypay vs. Suffolk lamb at same degree of mature size (0.70)

	Polypay	Suffolk
Mature size (lbs)	175	230
% of mature size	70%	70%
Liveweight	122	161
Muscle (lbs, [%BW])	33.0 [27.0]	43.3 [26.9]
Bone (lbs, [%BW])	8.0 [6.6]	9.6 <mark>[6.6</mark>]
Fat (lbs, <mark>[%BW]</mark>)	19.2 [15.8]	24.3 [15.8]

Feed efficiency is driven by body fat gain

Lamb Feed Efficiency:

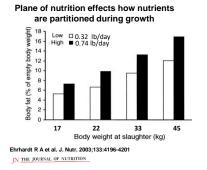

- Feed efficiency is influenced by diet, maturity and genetics.
- High efficiency ~3.0 lb feed/lb gain, but may be as poor as 8+ lb feed/lb gain.
- The lean growth phase (accumulation of muscle) is the most efficient. *There is more water and less energy in a pound of muscle than in a pound of fat.*
- Lamb feed efficiency is largely driven by the composition of gain (body composition) and hence hugely influenced by degree of lamb maturity.

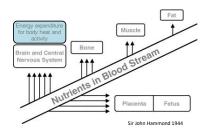

8

Body composition and rate of growth:

- Fat has lower priority for energy than does muscle so when animals are feed excess energy the relative partition into fat is greater (fattening diets!)
- Therefore, animals grown more slowly are leaner at any given maturity than those grown more quickly
- Backgrounding is a term used for a feeding program designed to limit the rate of growth allowing for a leaner animal at a given stage of maturity (% of mature size).

10

9

Lamb finishing concepts:

- Goal is to have adequate fat within muscle (intramuscular fat=marbling) for juiciness and flavor without excessive intermuscular fat (seam fat and subcutaneous fat).
- 4% intermuscular fat content is associated with higher eating quality in lamb
- Can we optimize genetics and feeding strategies to achieve this goal?

What is reasonable ballpark estimate for lamb size to efficiently create YG 2 (approx. 25% carcass fat)?

• Well fed lambs (wethers and ewes) reach the ideal carcass yield grade at 70% of the average maternal mature size of their sire and dam.

Sire: 330 lb Suffolk ram=230 lb Suffolk ewe Dam: 175 lb PolypayX ewe

Average maternal size: 202.5 lbs Ideal market lamb size= .7 x 202.5= 142 lbs

14

Variations on 70% maternal size rule:

- 1. Ram lambs can be grown to 75-80% maternal mature size.
- 2. Slowly grown lambs can be grown to 75% maternal mature size.
 - Grass-fed
 - ✓ Background feeding systems

Backgrounding feeding programs:

- Background feeding can be used to create larger market animals that are still relatively lean
- Backgrounding can be a good or bad strategy depending on:
 ✓ Market price fluctuations
 - ✓Impact of maturity on carcass quality
 - \checkmark Yardage cost: cost of maintaining an animal in a feeding facility
 - ✓ Mortality risk
 - \checkmark Cost of gain for backgrounding vs. feeding for fast growth

15

16

Comparison of annual crops grazed as part of a background rearing system for lambs

	Corn	Sudan	Brassica
ADG, lb/day Feed:Gain	0.32 11	0.32 10	0.38 10
DMI, % per day	5	5	5.8
Gain potential per acre	720	700	500
Cost of crop per acre	287	200	165
Cost of gain	0.40	0.39	0.33

20

21

Challenges with grazing lambs:

- Predation
- \checkmark Managed with predator-proof fencing or livestock guard dogs \bullet Parasite control
 - ✓ Managed with careful infection monitoring, grazing management, use of quality forages and judicious use of anthelmintics in combination
- Dietary energy level
- Manage with selective grazing and/or use of high energy forage species
- Pasture availability: Is there quality pasture available when it is needed?
 - ✓ Reserve hay/silage regrowth for grazing
 - ✓ Plant annual pastures or use cover crop grazing

22

Grazing management to maximize lamb growth:

• Maximizing intake is the key and is managed by controlling pasture allowance

• Do you seek maximum individual lamb gain or maximum gain per acre?

If finishing lambs on pasture, you may seek maximum individual gain but if backgrounding, then you are seeking maximum gain per acre.
High intakes are achieved by:

✓Grazing highly digestible forage

- ✓ Short grazing bouts
- ✓Greater allowance

≻Allows greater selectivity but will decrease quality over time

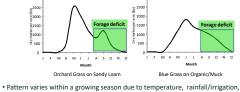

Lamb* gain on pasture according to forage quality and month of the year (Ehrhardt and Cassida, unpublished)

Average daily gain, Ibs/d	Forage allowance per day, ib DM/100 lb BW	TDN of forage, % (DM basis)	Month	Pasture specie(s)
0.65	10	66	July-August	Leafy brassica
0.60	10	64	July-August	Red clover, ryegrass
0.45	10	60	July-August	BMR Sudan
0.55	10	62	Sept-Oct	Brassica mix
0.40	10	62	Nov-Dec	Brassica mix
0.86	NA	80	All year**	Unlimited grain

*Dorset-cross wether lambs at 0.5 to 0.6 maturity

** Lamb gain can be lower in summer in feedlot under high heat conditions

Patterns of perennial grass growth in New York

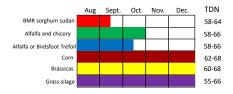

application of fertilizer, grazing/harvest management. • Growth slumps in late summer when greater mass and quality are needed for lamb

grazing

 Selective grazing can be a solution but in most commercial operations, stocking rates on permanent pasture limit this option

25

High energy forages that fill the late summer/fall gap:

26

rotation/pasture renovation plan. concept referred to as a "complementary forge system" Notation is farm-specific based on forage needs, production system, climate, soils, etc. Example: vanue: Annual forages for lamb finishing can be part of a comprehensive crop

✓ 30% of land is in permanent pasture
 ✓ 70% of remaining land in on a 8 year complimentary forage rotation

			Year of	frotation				
Paddock	1	2	3	4	5	6	7	8
Α	Perennial pasture	Perennial pasture	Perennial pasture	Perennial pasture	Perenrial pasture	Perennial pasture/Rape	Clover/Forbs	Clover/Forbs

н	Perennial pasture	Perennial pasture	Perennial pasture	Perennial pasture	Perenrial pasture/Rape	Clover/Forbs	Clover/Forbs	Perennial pasture

27

What about expanding your grazing onto neighboring land to finish lambs?

· Most of the high quality forage finishing options (especially brassicas!) work well as cover crops and can be high yielding after small grain harvest

Benefits of cover crop grazing:	
---------------------------------	--

Sheep farmer:	Crop farmer:
 Inexpensive, quality forage 	 Retention of soil nutrients
 Parasite-free grazing 	Erosion control
 Resting of permanent pastures 	 Enhanced residue recycling
 Extended grazing into winter 	Weed control

28

Objectives

To examine the growth performance, carcass and meat quality of lambs reared on four rearing systems:

Four treatments: N= 15 lambs per treatment
 GRN - Grain feedlot diet, 6 wks

BKG – 4 wks on pure brassica seeded cover crop, then 4 wks grain feedlot diet

BRO – Pure brassica seeded cover crop, 8 wks

MIX – Brassica cover crop mix, 8 wks

Feedlot and Grazing Management

Feedlot • Lambs were fed a transition diet from pasture to grain

- Unlimited feed at minimum 20% refusal
- · 6 weeks grain feeding for GRN
- Grazing

31

- · Lambs grazed for 6-8 day periods
- · Paddock biomass estimated weekly
- Paddock size was calculated weekly to provide a daily forage DM allowance of 9-10% of the pen's bodyweight

Slaughter

- · GRN slaughtered after 6-weeks of treatment
- BKG,BRO, MIX slaughtered after 8-weeks of treatment
- Lambs slaughtered 22 h after last weight measurement
- All carcass data was collected 24 h
 post slaughter

Economics of Lamb Finishing Systems

43

- <u>Summary</u> Lambs on grain diets grew faster and had greater carcass weight and fatness than those grazing
- Lambs on background rearing system exhibited marked compensatory growth and improved feed efficiency over those fed grain exclusively
- All lambs graded choice or better with grain-fed lambs have greater yield grade than those grazing
- Loin chops from grazing CC were darker with a deeper red color
- Intramuscular fat content (marbling) was in the range of 3.8-4.2% and did not differ between treatments
- Consumer sensory analysis revealed a preference for loin chops of lambs reared on brassica cover crop over those fed an exclusive grain diet in terms of juiciness and flavor
- Cost of gain was similar for pasture-reared and background lambs but the total profit over the finishing period was ${\approx}25\%$ greater for background lambs at current prices.
