Food webs show how different plants and animals interact - who eats whom. We can learn about them through observation - going outside and watching what animals eat. Carnivores eat meat, herbivores eat plants, and omnivores eat both.

Killer Whale: eats almost anything including birds, fish, and other marine mammals
Harbor Seal: eats a variety of fish
Sea Otter: eats crabs, sea urchins, and clams
Salmon: eats other small fish, plants
Sea Urchin: eats kelp
Kelp: makes its own food using sunlight

Is it a Carnivore, Omnivore, or Herbivore?

Kelp is a PRODUCER because it makes its own food.

1. Draw lines below to connect the animals and plants based on what they eat:
2. Think about what will happen to the food web if humans kill all of the salmon.
