Food webs are models of the interactions between living things in an ecosystem. We can learn about them through observation - watching what animals eat. Depending on their diet, each species is classified as a carnivore, herbivore, or omnivore.

1. Draw lines below to connect the animals and plants based on what they eat:

- Killer Whale: eats almost anything including birds, fish, and other marine mammals
- Harbor Seal: eats a variety of fish
- Sea Otter: eats crabs, sea urchins, and clams
- Salmon: eats other small fish, plants
- Sea Urchin: eats kelp
- Kelp: makes its own food using sunlight

2. Think about what will happen to the food web if humans kill all of the salmon.

1.
